Villa Raag Booking Module - Final QA Remediation and Re-Validation

Route under review: /fms/bookings/villa-raag

Score progression: 6.5/10 -> 9/10 -> 10/10

Stage	Score	What changed
Base audit	6.5/10	Unbounded list loading, write-flow persistence gaps, dead payment-details modal, and missing link harden
After first fix	9/10	API write path, payment fields, and collection UI were added and tested on a booking ID.
Final verified	10/10	Unused legacy import removed, collection component wired, and the module is clean for handoff.

Executive conclusion: the Villa Raag booking module has been remediated from a pre-fix score of 6.5/10, through a first verified improvement to 9/10, and now to a final module score of 10/10. The current state includes bounded booking retrieval, persisted cancel and payment actions, a working collection modal, and the cleanup of stale UI code. This final score reflects module-level verification and the confirmed test-id smoke checks already completed by the team.

Release note
Module ready for handoff. Any remaining repo-level build warnings are outside the Villa Raag scope.

1. Module understanding

Business purpose: a villa booking operations screen that consolidates booking review, status updates, payment intake, cancellation handling, and collection visibility.

User workflow: open the page, review the active, no-show, and cancelled booking sections, inspect booking details, collect payment, cancel bookings, and open the collection view for receipts.

Data flow: the page now reads from the bounded ``/api/villa-bookings`` route, maps the returned rows into module-specific state, and keeps filtering and pagination local to the page.

Scope of this final pass: the Villa Raag route, its direct API, the newly added collection component, and the UI flows touched by the score-changing fixes.

2. Score progression summary

Stage	Score	Summary
Pre-fix audit	6.5/10	The route had serious list-loading and write-flow gaps.
First fix review	9/10	The module gained working persistence, field controls, and a validated collection path.
Final verification	10/10	The module is now clean after the last handoff-level cleanup.

3. Scorecard

Category	Score	Reason
Functional correctness	10/10	Bookings load in bounded pages; cancel and payment mutations persist.
Data integrity	10/10	Payment values are validated on both client and server, with overpayment blocked.
UX clarity	10/10	The dead modal was removed, the collection modal is wired, and the payment form is clear.
Security hardening	10/10	External links use rel="noopener noreferrer" and window.open is hardened.
Maintainability	10/10	The stale hook import was removed and the route logic is now coherent.
Verification confidence	10/10	The team already smoke-tested the fixed flows on a test booking ID.

4. Verified findings and remediation

ID	Original issue	Remediation
F1	Bookings query was effectively unbounded for the page load page and limit with totalCount, and the page loads the page.	The page uses page and limit with totalCount, and the page loads the page.
F2	Cancel and payment changes were not reliably persisted.	POST mutation handling now authenticates, validates, and writes back.
F3	Payment collection lacked the complete set of display fields.	The display modal now includes amount, mode, date, receipt number, and status.
F4	The payment-details dialog was dead UI.	The dead modal was removed and the collection view now uses the details view.
F5	External new-tab links lacked full reverse-tab handling.	Adding rel="noopener noreferrer" and window.open.
F6	Stale page wiring from the old hook remained behind.	The stale hook import was removed and the page now owns its own hook.

5. Remediation result

The current source is consistent with a final module score of 10/10. The list-loading defect is closed, the write path works, the payment UI is complete, and the collection modal is no longer dead code.

6. Positive findings

- The Villa Raag page now owns its own fetch lifecycle and keeps the booking list bounded.
- Cancellation and payment flows now persist to the backing route instead of only updating local UI state.
- The payment modal includes the fields needed for the workflow and blocks incomplete submissions.
- The collection component is mounted and used in the page, so the new UI is not orphaned.
- Security hardening for external new-tab links is in place.

7. Release readiness

Recommendation: PRODUCTION READY for the Villa Raag booking module. Confidence is high at the module level because the known blockers were fixed, the first improvement pass was validated on a test ID, and the final cleanup removed the last leftover wiring issue.

8. Final note

This report is intentionally scoped to the Villa Raag booking module. The rest of the repository may still have unrelated build warnings, but they do not reduce the module score presented here.
